

Improving Stock Accuracy in Cold Storage Facilities

Background

Constellation is a Northern European logistics company providing Cold Storage and distribution services for frozen goods.

Challenge

- Stocktaking is a costly, slow and labor-intensive process, especially in cold storage where labor rules and costs are higher.
- Frequent audits and client-owned inventory require major stocktaking efforts across all warehouses.
- The operating environment reaches temperatures as low as -23°C , adding complexity and constraints to warehouse operations.

Solution

Deploying Sentispec Automated Stock Taking, they reduced the cost of stock counting by as much as 80% whilst cutting back on overtime, providing increased stock transparency to their customers, and reducing labour spent searching for misplaced pallets.
